DNA GENERATION.

ceramill®

THE INHOUSE MOVEMENT®
DNA GENERATION.
POWER + DENTAL INTELLIGENCE = PERFORMANCE

Our milling machines are fully created inhouse and exclusively at Amann Girrbach headquarters in Koblach, Austria. Based on our decades of experience in CNC technology and strong development skills we have the expertise to develop and manufacture our machines in-house from scratch. In-house development of all elementary components, and in particular the new control units, allows us to meticulously adapt and continually further develop our milling units to the specific requirements of dental technology. A distinctive profile emerges in terms of precision, speed and CAM processes, precisely adapted to the mechanical quality of dental materials – we call it the “Ceramill DNA”.

HARDWARE
Powerful components (drive-construction, spindle, etc.)

CONTROL UNIT
100 % built INHOUSE – with integrated “dental intelligence”

PROCESSES
Highly efficient milling strategies enabled through perfect integration of hard- and software

TIME SAVING
up to 60 % for milling and grinding
THE RIGHT CHOICE FOR EVERYONE.

- THRILLING

Easy entry or efficient upgrading.

5-axis technology concentrated in minimum space.

The power pack for highly efficient wet processing.

One for all – all in one.
Ceramill Mikro is an extremely robust and compact 4-axis milling machine for dry processing blanks and single blocks such as zirconia, hybrid ceramics or dry millable composite materials. Equipped with high-performance components for permanent stability, economy and precision with low investment costs, the Mikro enables easy entry into CAD/CAM fabrication in-house in the laboratory or optimises the efficiency and productivity of the laboratory routine. With the full range of conventional laboratory indications, Ceramill Mikro 4X paves the way to profitable in-house value creation, economy and accurately fitting framework quality without preparation or reworking.

- High Performance milling due to DNA milling strategies
- Easy entry or efficient upgrading thanks to low investment costs and high amortisation
- Highly versatile due to 4-axis dry processing of blanks and hybrid ceramic blocks
- Precise and durable thanks to high-quality components and robust machine design
High-frequency spindle
extremely robust and precise

6 tool spaces
with automatic tool changer

Blank holder
conversion in only a few steps

Interior lighting
for visual control of milling

Tool length measuring unit
incl. fracture check

Presence sensor
for milling tools

Connection for extraction protects
the internal mechanism against contamination
optimum with Ceramill Airstream,
but also for central extraction
5-AXIS TECHNOLOGY CONCENTRATED IN MINIMUM SPACE.

Splints, bars, implant bridges – the 5-axis unit Ceramill Mikro 5X not only masters conventional crown and bridge work but was also designed for fabricating more complex indications with dry millable materials. The high rigidity and stability of the machine are based on the compact construction design of the sister model Ceramill Mikro 4X, without having to forego the advantages of 5-axis technology. The result is absolutely low-vibration processing, which in combination with Ceramill control technology produces impressive precision on the blank. Fast processing times, maximum quality and a wide range of indications and materials make the Ceramill Mikro 5X a genuine winner in the laboratory in terms of productivity.

- High Performance milling due to DNA milling strategies
- Maximum range of indications in the 5-axis dry milling/grinding category
- Space-saving, compact design with the latest 5-axis technology
- Fast, stable and efficient thanks to low-vibration monocoque design
- High-quality machine components guarantee constantly high precision and durability

Standard milling strategies 5-axis exterior processing using Ceramill CAD/CAM
High-frequency spindle
extremely robust and precise

8 tool spaces
with automatic tool changer

Blank holder
conversion in only a few steps

THE POWER PACK WITH THE PATENTED “CARVING MODE”.

This compact 4-axis milling unit extends inhouse fabrication of conventional laboratory indications to include the option of wet grinding/milling. Titanium abutment blanks can also be processed with this unit in the same way as composites, hybrid and glass-ceramics. The monocoque design, the solidly designed axis system as well as powerful high-frequency spindles transfer the respective milling strategies precisely and at high feed speeds to the workpiece. This is particularly effective when grinding in the patented “Carving Mode”. This innovative grinding process reduces the processing times of single blocks up to 60%.

With the new “Thrilling Mode”, it is also possible to “thrill” block assemblies including the connection geometries from standard CAD blocks. This is yet another profitable in-house indication which finds its way back into the laboratory and expands the versatile Ceramill CAD/CAM portfolio.

- High Performance processing due to DNA milling/grinding strategies
- Carving Mode reduces processing times of blocks up to 60%
- Solid design enables the highest degree of precision with maximum feed rates
- Special holder design ensures easy handling and accuracy when processing hard materials (titanium, glass-ceramics etc.)

“Carving Mode” - excess material is being cut off as a whole
Fabrication of one-piece/multi-piece abutments from hard block materials
Interior lighting
for visual control of milling

Super-high frequency spindle
highly precise, stable, quiet running

8 tool spaces
with automatic tool changer

Tool length measuring unit
incl. fracture check

Presence sensor
for milling tools

Blank holder
conversion in only a few steps

Coolant supply tank connection
large volume capacity ensures long operating cycles
The Ceramill Motion 2 is a benchmark in terms of the range of indications and materials in-house. The 5-axis milling unit combines wet and dry processing in one unit and enables the value-creation chain to be kept virtually completely in-house in the laboratory. The Ceramill Motion 2 can be used either as a purely dry or wet unit or in combined operation for an unlimited range of materials and indications.

Equipped with the innovative control technology and robust machine concept from Amann Girrbach, the Ceramill 2 is guaranteed to be future-proof, economic and precise.

- High Performance milling, grinding, carving (patented), thrilling due to DNA milling/grinding strategies
- Maximum range of materials and indications thanks to 5-axis wet and dry processing in one unit
- Innovative processing procedures ensure maximum ROI (e.g. rotational milling of titanium, processing of full dentures)
- Intelligent machine design guarantees optimum protection of all electronic components during wet operation

“Carving Mode” – excess material is being cut off as a whole

Fabrication of one-piece/multi-piece abutments from hard block materials

up to 60% saving in time during grinding
Standard milling strategies

5-axis exterior processing using Ceramill CAD/CAM

Ceramill Coolstream – integrated coolant preparation in the cart and connection for the Airstream extraction during dry processing

Super-high frequency spindle
highly precise, stable, quiet running

Tool length measuring unit
incl. fracture check and calibration

Blank holder
exchangeable, depending on material or indication

6 tool spaces
with automatic tool changer

Blank holder and wet/dry processing mode in only a few steps

Suction cup
for increased suction performance and reduction of spray water

Coolant supply tank connection
large volume capacity ensures long operating cycles

Easy change of the blank holder for conversion from milling to grinding
HIGH TECH SOUL.
NEWLY DEVELOPED FROM SCRATCH - CONTROL TECHNOLOGY FOR MAXIMUM DENTAL PERFORMANCES
CNC ≠ CNC. 35 YEARS OF EXPERIENCE IN MACHINE CONSTRUCTION – CONDENSED FOR DENTAL TECHNOLOGY.

CNC-controlled dental milling units are now mainly defined by a wide range of applications and a great scope of processable materials. The quality of a CNC unit, however, is not only defined by its equipment details and versatility from a dental technology aspect. Decisive for the long-term precision and stability of a CNC unit are the structural design and reduction of moveable parts to a minimum. The more compact and low-vibration of the construction, the greater the possibility of long-term smooth operation while maintaining the necessary precision.

In addition to an intelligent design, which guarantees the stability and torsion resistance of the machine, the processing accuracy of desktop machines is decisively influenced by the quality of their construction components. Axis guidance and spindle thus contribute significantly to compensating for the forces and vibrations generated during the milling/grinding process. The components used in Ceramill CNC units are well above the load limit, independent of the material to be processed. In combination with the robust design, they ensure long-term process reliability and milling and grinding results of maximum precision.
MILLING, GRINDING, + CARVING + THRILLING - POWER AND INTELLIGENCE BUNDLED FOR ULTIMATE PERFORMANCE

Our dry and wet units are equipped with quite-running and powerful high performance spindles. Therefore maximum productivity can be achieved. Even material that is very hard to process, like hybrid ceramics or lithium disilicate, can now be processed with up to 100,000 rpm which makes them the most powerful component that can be used for desktop mills. The interplay of control, drive components, spindle and tools is of key importance, as a strong performance can only be achieved in combination with correspondingly designed milling strategies. Perfectly balanced these parameters result in big savings of processing time maintaining the highest precision standard (HD milling).

The latest development resulting out of these enhancements is a brand new processing strategy we call “Carving Mode”. Grinding in “Carving Mode” can result in up to 60% time savings.

With the new “Thrilling Mode”, it is also possible to “thrill” block assemblies including the connection geometries from standard CAD blocks. This is yet another profitable in-house indication which finds its way back into the laboratory and expands the versatile Ceramill CAD/CAM portfolio.

- Hybrid bearing, high-performance, high-frequency spindle (100,000 rpm)
- Highly efficient processing of hybrid materials with the highest precision
- Reduction of grinding times up to 60%
- Optimally protected against dust, chips and liquids

* Average performance data of normal market desktop mills
The patented “Carving Mode” - is based on the CNC technique of trochoidal milling, which Amann Girrbach transferred to the processing of dental hybrid and glass-ceramics using grinding tools. In contrast to conventional milling or grinding, the tool does not follow a linear, constant feed movement during trochoidal processing but moves over curved paths, so-called trochoids. In this way excess material is completely separated, thus avoiding grinding down the blank to the actual geometry. Low machining forces and their uniform distributions over the entire tool length enable higher processing speeds, resulting in significantly shortened fabrication times with increased service life and component quality. The procedure, unprecedented in dental CAD/CAM technology until now, results in a massive saving in time when fabricating single-tooth indications made from hybrid or glass-ceramic and corresponds to processing times using a twin spindle.

**AVERAGE GRINDING TIMES PER CROWN (MOLAR REGION)**
Industrial CNC guidance unit – highly precise, torsion resistant / designed with a minimum of moveable parts

Highly precise, durable spindle with a concentricity of ≤ 1μm

CNC axis system designed for high loading; short processes for long-term stability

Milling area separated from the control unit to avoid dust on electronic components

Electronic components installed in the housing

Very compact machine design
D/W/H: 465 x 515 x 585 mm
Industrial CNC guidance unit – highly precise, torsion resistant / designed with a minimum of moveable parts

Powerful. Super-high frequency spindle with speeds up to 100,000 rpm

Milling area separated from the control unit to avoid dust on electronic components. Monocoque chassis guarantees absolute stability

Solid axis system enables high milling speeds with maximum precision

Electronic components installed in the housing

Very compact machine design
D/W/H: 465 x 580 x 585 mm
ROTATIONAL MILLING TITANIUM ABUTMENT BLANKS.
(UPGRADE)

What was only previously possible via industrial processing centres and large milling machines is now possible in the familiar high quality using the Ceramill Mikro IC and Ceramill Motion 2 with the rotational milling technique in the wet-milling mode. In contrast to conventional milling, in which the blank mainly remains in a static position, with so-called “multi-pass milling” the blank rotates continuously about its own axis. This not only saves the travel paths of the cutter, but also creates a surface quality with an equally precise and even milled surface. A special holder geometry enables the blank to be fixed, absolutely clamped and distortion-free and processed rotationally symmetric. Precise calibration guarantees that the height and angle of the custom abutment are correctly fabricated to the connection geometry.

Manufacturing costs of titanium abutments

- In-house Amann Girrbach: 100%
- Milling centre: 90%
- Implant manufacturer: 80%
- Outsource milling centre: 70%
- Up to 80% saving in cost

Precision calibration ensures the correct alignment of abutment and implant connection geometry

Blank holder for in-house fabrication of titanium abutments using the Ceramill Motion 2
Modular, flexible, versatile – the Plug & Play quick-change holder concept enables full exploitation of the material and indication potential of each Ceramill unit. In this way users have the option of flexibly and cost-effectively extending their milling unit to include new materials or adapting it to changing requirements. Handling is easy and uncomplicated thanks to effortless attachment of the blank holder to the connection bolts in the inside of the machine. The tool holder connected to the blank holder ensures that milling cutters or grinders for the respective material remain permanently in position.

MILL IN THE LABORATORY - EASILY, QUICKLY AND PRECISELY.

The automatic, clear user interface of the Ceramill Match 2 CAM software provides reliable, simple operation. Experience in CAM or milling is not required for use. Even users with little experience can easily and quickly create milling programmes for fabricating crown and bridge frameworks using the interface. An ingenious Ceramill Match 2 collision control (and collision avoidance) guarantees a high degree of process reliability.

- Easy positioning and aligning of frameworks in the blank
- Easy changing of the position, size and alignment of connectors
- Fast calculation of milling paths
- Sinter cushion in thermodynamically optimum design shape for accurately fitting sintering of long-span zirconia restorations

Intelligent nesting concept according to the VITA Classical shade guide

Processing of VITABLOCS® TriLuxe forte using rendered representation of the shade gradient

Easy positioning of the connectors on the frameworks

### MILLING AND GRINDING TOOLS FOR CERAMILL CAD/CAM

CNC milling and grinding tools are essential components in processing dental materials. The quality, geometry, coating and number of blades of tools contribute greatly to the surface quality, detail definition and precision of a restoration. Based on this, we meticulously match our milling and grinding tools to the material-specific milling strategies, design parameters and, of course, the material itself. In this way, we not only guarantee perfect framework quality but also optimum service lives as well as smooth, efficient milling and grinding processes.

An overview, including ordering information about all Ceramill CAD/CAM milling and grinding tools can be found at: www.amanngirrbach.com
